ABSTRACT

A small collection of plants from the basal part of the Itararé Subgroup (Late Paleozoic), near Salto, São Paulo State, contains *Samaropsis*, *Cordaicarpus*, *Carpolithus*, (?)*Trigonocarpus*, (?)*Noeggerathiopsis* and (?)*Paracalamites*, associated to fragments of smooth and striate stems, leaves and possible fructifications. It is probably the lowermost occurrence of Late Paleozoic plant fossils in the northern part of Paraná Basin.
