Families of G-Structures

Ivan Struchiner[1], Rui Loja Fernandes[2]

[1] Universidade de São Paulo

[2] UIUC

In this talk I will discuss smooth families of G-structures (geometric structures) parameterized by a manifold X. I will explain how usual constructions on a single G-structures can be performed for families (e.g., associated bundle, compatible connections, etc...) and I will give results about the moduli spaces that apear. I will also point out possible directions for future research on the topic.
